PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/615,764	Applicant(s) PARRY ET AL.	
	Examiner GERALD SMARTH	Art Unit 2446	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 18 December 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1,2,7-15,25-29 and 41-52 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1,2,7-15,25-29 and 41-52 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. The instant application having Application No. 10/615764 has a total of 31 claims pending in the application; there are 4 independent claims and 27 dependent claims, all of which are ready for examination by the examiner.
2. Claims 1-2, 7-16, 25-28, 41, 45-47, & 51-52 are presented for examination. Claims 1, 7, 41, 47 are independent claims. The remaining claims are dependent on claims 1, 7, 41, 47. Claims 25 & 47 are being amended. Claim 3 is being cancelled.
3. The Rejections are respectfully maintained and reproduced infra for application's convenience.

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1 & 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Muto(US 2002/0116480) , and Tabb (US 6735399 B2) , Kinoshita(2003/0107762) in view of Kurtz (2002/0075500),

Regarding claim 1, Muto teaches a method of providing email messages to a printing device, ***(Muto discloses the present invention has been developed to solve the above mentioned problems, and the first object of the present invention is to provide a data transfer process apparatus, a device, a network system, a data transfer method, and a storage medium capable of having the user who manages the device recognize the status of the device at an appropriate timing by transmitting by electronic mail the transmission data generated according to the message for the status information about the device based on the status change of the device and the destination information; Page 1 paragraph 10)*** said method comprising attaching a memory module storing said email messages to a printing device consumable.

Muto does not specifically teach method comprising attaching a memory module storing said email messages to a printing device consumable.

However Tabb does teach a method comprising attaching a memory module storing said code to a printing device consumable.

(Tab discloses this invention can also be used to change machine setup and aging algorithms to solve problems post-launch which may or may not be related to the particular CRU 1 which contains the CRUM 30. For example, a toner cartridge CRUM may provide the above described software code updates for the operation of a CRU 1. This is quite desirable as toner cartridges are typically replaced much more often than printer cartridges. Thus, a post-launch software

Art Unit: 2446

update or upgrade can be resident in a machine 100 at a much earlier time than if it was distributed by a less often replaced CRU 1; Column 6 lines 7-16)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system to include the replaceable consumable printing device with memory of Tabb. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and direct way to make software upgrades to deal with errors, toner/printer problems, manufacturer information changes of both printer and printing device consumables, without having to make a physical visit by a technician.

Tabb discloses many machines have replaceable sub-assemblies. Printing machines for example may have a number of replaceable sub-assemblies such as a fuser print cartridge, a toner cartridge, or an automatic document handler. These subassemblies may be arranged as a unit called a cartridge, and if intended for replacement by the customer or machine owner, may be referred to as a CRU. Examples of a CRU may include a printer cartridge, toner cartridge, or transfer assembly unit. It may be desirable for a CRU design to vary over the course of time due to manufacturing changes or to solve post launch problems with either: the machine, the CRU, or a CRU and machine interaction. Further, design optimizations may be recognized subsequent to design launch and machine sale, that a relatively simple code update might realize. However, solving these problems, or providing optimization updates, generally requires a field call; Column 1 lines 41-47)

uploading said email messages from the memory module of the printing device

Art Unit: 2446

consumable to the printing device; and transmitting said email messages from the printing device to a recipient to indicate a condition relating to the printing device.

Neither Mutto nor Tabb explicitly discloses emails being stored on a memory module.

However Kinoshita teaches emails being stored on memory. **(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)**

Further it would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system and Tab's replaceable consumable printing device with memory to include Kinoshita's Printing system. One of ordinary skill in the art would have been motivated to make this modification in order to

Art Unit: 2446

show emails can be stored in a removable/remote memory and transmitting email to a printer's memory. This will allow for easier printing of emails at any given time.

Mutto, Tabb, nor Kinoshita explicitly discloses uploading said email messages from the memory module of the printing device consumable to the printing device; and transmitting said email messages from the printing device to a recipient to indicate a condition relating to the printing device.

However the combination with Kurtz does teach uploading said email messages from the memory module of the printing device consumable to the printing device; and transmitting said email messages from the printing device to a recipient to indicate a condition relating to the printing device. **(Kurtz does teach in embodiments of the present invention, various methods and systems are envisioned. For example, the memory storage device may include a contact for ordering a replacement CRU and the printing machine may print a document including at least the identification code of the CRU and a contact for ordering a replacement CRU upon a condition in the CRU. The printing machine may send an electronic mail message including at least one of the identification code of the CRU and a contact for ordering a replacement CRU to a computer. The CRU may be a toner cartridge and the memory storage device may include a contact for ordering a replacement toner cartridge and the printing machine may print a document including at least the identification code of the toner cartridge and a contact for ordering a replacement toner cartridge. The printing machine may print a document including a URL address for electronic ordering of a CRU; or a URL**

Art Unit: 2446

address for obtaining instructions on obtaining a replacement CRU; Paragraph**46)**

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Muto, Tabb and Kinoshita to include Kurtz's replaceable consumable printing device system which can also send email notifications. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and direct way to notify users about errors, problems, consumption and manufacturer information of printing device consumables.

A user may be informed when a marking material in a CRU is at a level too low to confidently print any further jobs. Once a user is signaled of a problem, a further problem is that, at a time of recognized need, the user may not have the necessary information readily in their possession in order to make a decision with respect to a replacement CRU. For example, the user may not possess the manufacturer's recommended CRU replacement model, the user may not know where to order the CRU, the user may not have the CRU manufacturer or vendor(s) contact information, the user may not know how to remove and recycle the CRU, or the user may not know how to install the replacement CRU. Such beneficial information is most useful when a user is notified that a CRU will soon run out of a substance or when the CRU is at or near the end of its useful life. In view of these problems, the present invention proposes a method and system which provides a user with various useful information concerning the CRU in the form of a printed document. The method and system makes the CRU information available to the user at the source of the problem, and at an identified time

Art Unit: 2446

of need in the printing machine. The information is provided in one convenient place, in the form of a printed document; Kurtz Page 1 Paragraph 3 & 4.

Therefore, it would be obvious to combine Muto, Tabb, Kinoshita, and Kurtz to arrive to the limitations of claim 1.

Regarding claim 2, Muto, Tabb Kinoshita in view of Kurtz taught the method of claim 1, as described above. Tabb also teaches further comprising: installing said printing device consumable in said printing device; and interfacing said printing device and said memory module (**Fig.1 element 1, & 100**). **(Tabb discloses the present invention relates to utilizing memory provided in a machine replaceable sub-assembly to be one medium of distribution for software code updates to that machine relating as to how that machine should use that replaceable sub-assembly. In one embodiment, there is provided a replaceable sub-assembly for use in a machine at various setpoints including a memory and further including upgraded executable instruction suitable for directing the machine to use the replaceable sub-assembly with different setpoints, where the upgraded executable instruction is stored in the memory. In this way, the replaceable sub-assembly becomes the medium for it's own or another's software updates; Abstract)**

(Cancelled) Regarding claim 3, Muto, Tabb in view of Kinoshita taught the method of claim 2, as described above. Kinoshita also teaches further comprising uploading said email messages from said memory module to a memory of said printing device. .

Art Unit: 2446

(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)

6. Claims 7-16, 25-28, 41, 45-47, and 51-53 are rejected under 35 U.S.C. 103(a) as being unpatentable over Muto(US 2002/0116480) , and Tabb (US 6735399 B2) in view of Kinoshita(2003/0107762),

Regarding claim 7, Muto,Tabb in view of Kinoshita teaches a method for providing email messages for email alerts from a printing device(***Muto fig. 10***), (***Muto discloses the present invention has been developed to solve the above mentioned problems, and the first object of the present invention is to provide a data transfer process***

Art Unit: 2446

apparatus, a device, a network system, a data transfer method, and a storage medium capable of having the user who manages the device recognize the status of the device at an appropriate timing by transmitting by electronic mail the transmission data generated according to the message for the status information about the device based on the status change of the device and the destination information; Page 1 paragraph 10) said method comprising: storing email messages on a memory module; attaching said memory module to a printing device consumable; installing said printing device consumable with attached memory module in a printing device; ***(Tabb discloses the CRU 1, as already mentioned, is removable from the machine 100 and can be replaced by another CRU 1 if any of the process elements located therein begin to deteriorate. The CRU 1 has a memory chip or memory 30, as shown in FIG. 3, in the form of an EEPROM (Electrically Erasable Programmable Read Only Memory) mounted in the top cover of the CRU 1. Contact pads 31 are provided on the memory chip 30 so that, when the CRU 1 is inserted into the machine 100, the memory chip 30 is automatically connected to the machine control unit/CPU via a terminal block 32 on a part 33 of the machine 100; Column 4 lines 26-36)***

and interfacing said memory module with said printing device. ***(Tabb discloses Indeed, in one embodiment the software which is installed from the CRUM 30 to the CPU 41 and its memory 42 has nothing to do with the medium or media of distribution i.e. the the CRU 1; Column 6 lines 17-20)***

Art Unit: 2446

Mutto does not explicitly teach storing attaching said memory module to a printing device consumable; installing said printing device consumable with attached memory module in a printing device; and interfacing said memory module with said printing device.

However Tabb does teach storing attaching said memory module to a printing device consumable; installing said printing device consumable with attached memory module in a printing device; and interfacing said memory module with said printing device.

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system to include the replaceable consumable printing device with memory of Tabb. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and direct way to make software upgrades to deal with errors, toner/printer problems, manufacturer information changes of both printer and printing device consumables, without having to make a physical visit by a technician.

Tabb discloses many machines have replaceable sub-assemblies. Printing machines for example may have a number of replaceable sub-assemblies such as a fuser print cartridge, a toner cartridge, or an automatic document handler. These subassemblies may be arranged as a unit called a cartridge, and if intended for replacement by the customer or machine owner, may be referred to as a CRU. Examples of a CRU may include a printer cartridge, toner cartridge, or transfer assembly unit. It may be desirable for a CRU design to vary over the course of time due to manufacturing changes or to solve post launch problems with either: the machine, the CRU, or a CRU and machine

Art Unit: 2446

interaction. Further, design optimizations may be recognized subsequent to design launch and machine sale, that a relatively simple code update might realize. However, solving these problems, or providing optimization updates, generally requires a field call; Column 1 lines 41-47)

Neither Mutto or Tabb specifically teaches emails being stored on a memory module.

However Kinoshita teaches emails being stored on memory. **(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)**

Further it would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system and Tab's replaceable consumable printing device with memory to include Kinoshita's Printing system. One of ordinary skill in the art would have been motivated to make this modification in order to

Art Unit: 2446

show emails can be stored in a removable/remote memory and transmitting email to a printer's memory. This will allow for easier printing of emails at any given time.

Therefore, it would be obvious to combine Muto, Tabb, and Kinoshita to arrive to the limitations of claim 7.

Regarding claim 8, Muto, Tabb and Kinoshita taught the method of claim 7, as described above. Tabb further teaches wherein said printing device consumable comprises a toner cartridge. **(Tabb discloses examples of a CRU may include a printer cartridge, toner cartridge, or transfer assembly unit; Column 1 lines 38-40)**

Regarding claim 9, Muto, Tabb and Kinoshita taught the method of claim 7, as described above. Kinoshita also teaches further comprising uploading said email messages from said memory module to a memory unit of said printing device.

(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index

generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)

Regarding claim 10, Muto, Tabb and Kinoshita taught the method of claim 9, as described above. Muto further teaches comprising sending an email alert to one or more recipients using one of said email messages indicative of a condition of said printing device. ***(Muto fig.10, fig, 11)***

Regarding claim 11, Muto, Tabb and Kinoshita taught the method of claim 10, as described above. Muto further teaches wherein said email messages comprise fields for containing printing device information. ***(Muto discloses in FIG. 10, reference numeral 1001 denotes a mail header portion, that is, a data portion containing the transmission information about electronic mail, and comprises the information indicated by 1002 to 1005; Page 5 paragraph 65 lines 5-8)***

Regarding claim 12, Muto, Tabb and Kinoshita taught the method of claim 11, as described above. Muto further teaches wherein said printing device information comprises an identification of said printing device. ***(Muto discloses in FIG. 10, reference numeral 1001 denotes a mail header portion, that is, a data portion containing the transmission information about electronic mail, and comprises the***

information indicated by 1002 to 1005; Page 5 paragraph 65 lines 5-8)

Regarding claim 13, Muto, Tabb and Kinoshita taught the method of claim 11, as described above. Muto further teaches wherein said printing device information comprises a quantification of a remaining amount of a consumable. ***(Muto discloses FIG. 6 shows an example of the status message data showing each status of the device stored in the device control unit of the device shown in FIG. 1 according to the first embodiment of the present invention; Page 20 paragraph 20)***

Regarding claim 14, Muto, Tabb and Kinoshita taught the method of claim 11, as described above. Wherein said email message comprises an order for additional consumables sent to a provider of said consumables.

Muto, Tabb and Kinoshita do not explicitly teach wherein said email message comprises an order for additional consumables sent to a provider of said consumables.

However Kurtz does teach wherein said email message comprises an order for additional consumables sent to a provider of said consumables.

(Kurz discloses For machines connected to a PC/network, at S310, an electronic e-mail message is sent to a user(s) indicating the predetermined information, for example, a message indicating low CRU life for a particular CRU along with information for ordering a replacement CRU including identification number and contact information including vendor(s), manufacturer(s), or third parties including their respective address, phone number, facsimile number, e-mail

***address, Uniform Resource Locator (URL) address, and combinations thereof;
Page 3 paragraph 31 lines 1-10)***

Regarding claim 15, Muto, Tabb and Kinoshita taught the method of claim 10, as described above. Muto also teaches wherein said sending an email alert comprises: monitoring operation of said printing device for occurrence of a trigger event; inserting said printing device information into said email messages; and sending said email alert using said email messages in response to said trigger event, wherein said email messages are specific to the trigger event detected. ***(Muto discloses FIG. 10 shows an example of transmitting electronic mail when an error occurs in the device generated by the network control unit of the device shown in FIG. 7 according to the first and third embodiments of the present invention; Page 2 Paragraph 24)***

Regarding claim 16, Muto, Tabb and Kinoshita taught the method of claim 15, as described above. Muto further teaches comprising receiving user input to specify a list of trigger events. ***(Muto fig. 8, & 9)***

Regarding claim 25, Muto, Tabb and Kinoshita taught the method of claim 9, as described above. Muto further teaches wherein said uploading said email message elements to printing device memory comprises: determining if previous email message elements already exist in said printing device memory; ***(Mutu discloses the mail notification setting information obtaining unit 1108 obtains the mail notification***

Art Unit: 2446

setting information set by the client apparatus 1301 through the network interface 1114. The mail notification setting information registration unit 1109 updates the mail notification setting information stored in the mail notification setting information memory 1107 according to the mail notification setting information obtained by the mail notification setting information obtaining unit 1108. In addition, if a mail notification condition that, for example, a status notification is issued only when an error occurs is changed in the above mentioned mail notification setting information, then the device status notification condition setting unit 1110 sets a status notification condition of the device 1101 notified by the device control unit 1102; Page 6 paragraph 85) and uploading said email message elements to printing device memory if no previous email message elements are found. **(Mutto discloses in the network control unit 103, the device status change detection unit 107 obtains the information (status information) about the status of the device 101 from the device control unit 102. The mail message generation unit 108 generates transmission data to be transmitted to the client apparatus 301 according to the information about the status of the device 101 obtained from the device status change detection unit 107, and the notification information (destination information). Furthermore, the mail message generation unit 108 sets the reply destination address of the electronic mail in the above mentioned transmission data. The reply destination address refers to the address to which an answer is transmitted in response to the electronic mail; Page 3 paragraph 41, 43)**

Regarding claim 26, Muto, Tabb and Kinoshita taught the method of claim 9, as described above. Muto further teaches wherein said uploading said email message elements to printing device memory comprises: determining if previous email messages already exist in said memory unit of said printing device; and performing a replacement action if previous email message elements are found. ***(Muto discloses in the network control unit 103, the device status change detection unit 107 obtains the information (status information) about the status of the device 101 from the device control unit 102. The mail message generation unit 108 generates transmission data to be transmitted to the client apparatus 301 according to the information about the status of the device 101 obtained from the device status change detection unit 107, and the notification information (destination information). Furthermore, the mail message generation unit 108 sets the reply destination address of the electronic mail in the above mentioned transmission data. The reply destination address refers to the address to which an answer is transmitted in response to the electronic mail; Page 3 paragraph 41, 43)***

Regarding claim 27, Muto, Tabb and Kinoshita taught the method of claim 26, as described above. Muto further teaches wherein said performing a replacement action comprises replacing one or more of said previous email messages with one or more email messages from said memory module. ***(Muto discloses in step S1502, the network control unit 1103 compares the contents between the received mail***

Art Unit: 2446

notification setting information and the mail notification setting information stored in the mail notification setting information memory 1107 in the network control unit 1103. If it is determined that there is a change in the mail notification setting information, control is passed to step S1503. If it is determined that there is no change in the mail notification setting information, then the process terminates; Page 7 Paragraph 101)

Regarding claim 28, Muto, Tabb and Kinoshita teaches the method of claim 26, as described above. Muto further teaches wherein said performing a replacement action comprises adding one or more of said email messages from said memory module to said previous email messages. ***(Muto discloses step S1502, the network control unit 1103 compares the contents between the received mail notification setting information and the mail notification setting information stored in the mail notification setting information memory 1107 in the network control unit 1103. If it is determined that there is a change in the mail notification setting information, control is passed to step S1503. If it is determined that there is no change in the mail notification setting information, then the process terminates; Page 7 Paragraph 101)***

Regarding claim 47, Muto teaches a printing device comprising: a printing device controller with an email engine ***(Muto fig. 1 element 103 & element 108)*** for using

Art Unit: 2446

email messages provided by a memory module attached to a printing device consumable; a printing device memory storing said email engine; and a printing device interface disposed and configured to interface and communicate with said memory module attached to a printing device consumable supplied to said printing device

Wherein said printing device controller is configured to access email messages in said memory module attached to said consumable, load said email messages into said printing device memory and selectively transmit said email messages using said email engine.

(Muto discloses additionally, according to the above mentioned conventional technology, when the status of the device is limited to a predetermined state and notified of by electronic mail, it is necessary to set a notification condition for each status of the device, thereby introducing the problem that the setting load of the user becomes heavier with an increasing number of types of status; Page 1 paragraph 8. Muto further discloses FIG. 10 shows an example of transmitting electronic mail when an error occurs in the device generated by the network control unit of the device shown in FIG. 7 according to the first and third embodiments of the present invention; Page 2 Paragraph 24)

Mutto does not explicitly teach a memory module attached to a printing device consumable; a printing device memory storing said email engine; and a printing device interface disposed and configured to interface and communicate with said memory module attached to a printing device consumable supplied to said printing device.

However Tabb does teach a memory module attached to a printing device consumable; a printing device memory storing said email engine; and a printing device interface disposed and configured to interface and communicate with said memory module attached to a printing device consumable supplied to said printing device. .

(Tabb discloses the CRU 1, as already mentioned, is removable from the machine 100 and can be replaced by another CRU 1 if any of the process elements located therein begin to deteriorate. The CRU 1 has a memory chip or memory 30, as shown in FIG. 3, in the form of an EEPROM (Electrically Erasable Programmable Read Only Memory) mounted in the top cover of the CRU 1. Contact pads 31 are provided on the memory chip 30 so that, when the CRU 1 is inserted into the machine 100, the memory chip 30 is automatically connected to the machine control unit/CPU via a terminal block 32 on a part 33 of the machine 100; Column 4 lines 26-36)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system to include the replaceable consumable printing device with memory of Tabb. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and direct way to make software upgrades to deal with errors, toner/printer problems, manufacturer information changes of both printer and printing device consumables, without having to make a physical visit by a technician.

Tabb discloses many machines have replaceable sub-assemblies. Printing machines for example may have a number of replaceable sub-assemblies such as a fuser print

Art Unit: 2446

cartridge, a toner cartridge, or an automatic document handler. These subassemblies may be arranged as a unit called a cartridge, and if intended for replacement by the customer or machine owner, may be referred to as a CRU. Examples of a CRU may include a printer cartridge, toner cartridge, or transfer assembly unit. It may be desirable for a CRU design to vary over the course of time due to manufacturing changes or to solve post launch problems with either: the machine, the CRU, or a CRU and machine interaction. Further, design optimizations may be recognized subsequent to design launch and machine sale, that a relatively simple code update might realize. However, solving these problems, or providing optimization updates, generally requires a field call; Column 1 lines 41-47)

Neither Mutto or Tabb specifically teaches emails being stored on a memory module and loaded onto printing device memory.

However Kinoshita teaches emails being stored on a memory module and loaded onto printing device memory. **(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in**

Art Unit: 2446

the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)

Further it would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system and Tab's replaceable consumable printing device with memory to include Kinoshita's Printing system. One of ordinary skill in the art would have been motivated to make this modification in order to show emails can be stored in a removable/remote memory and transmitting email to a printer's memory. This will allow for easier printing of emails at any given time.

Therefore, it would be obvious to combine Muto, Tabb, and Kinoshita to arrive to the limitations of claim 47.

Regarding claim 51, Muto, Tabb and Kinoshita taught the printing device of claim 47, as described above. Kinoshita further teaches wherein said printing device interface comprises a wired interface. . **(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for**

Art Unit: 2446

which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)

Regarding claim 52, Muto, Tabb and Kinoshita taught the printing device of claim 47, as described above. Further comprising a user interface for controlling said printing device. *(Muto discloses in the network control unit 1103, the mail notification setting screen generation unit 1105 generates GUI (Graphical User Interface) data displayable on the GUI of the WEB browser, etc. operating in the client apparatus 1301. The GUI data generated by the mail notification setting screen generation unit 1105 is transmitted to the client apparatus 1301 through the network interface 1114, thereby providing a GUI for setting mail notification as shown in FIG. 13 in the client apparatus 1301. The WEB browser of the client apparatus 1301 interprets the received GUI data, and displays a screen as shown in FIG. 13. Thus, the user can set mail notification without an application program exclusively used to set mail notification; Column 6 paragraph 82)*

7. Claim 14 rejected under 35 U.S.C. 103(a) as being unpatentable over Muto (US 2002/0116480) ,Tabb (US 6735399 B2) , Kinoshita(2003/0107762) in view of Kurz (US 2002/0075500) .

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Muto, Tabb and Kinoshita to include Kurtz's replaceable consumable printing device system which can also send email notifications. One of ordinary skill in the art would have been motivated to make this modification in order to have a more efficient and direct way to notify users about errors, problems, consumption and manufacturer information of printing device consumables.

A user may be informed when a marking material in a CRU is at a level too low to confidently print any further jobs. Once a user is signaled of a problem, a further problem is that, at a time of recognized need, the user may not have the necessary information readily in their possession in order to make a decision with respect to a replacement CRU. For example, the user may not possess the manufacturer's recommended CRU replacement model, the user may not know where to order the CRU, the user may not have the CRU manufacturer or vendor(s) contact information, the user may not know how to remove and recycle the CRU, or the user may not know how to install the replacement CRU. Such beneficial information is most useful when a user is notified that a CRU will soon run out of a substance or when the CRU is at or

Art Unit: 2446

near the end of its useful life. In view of these problems, the present invention proposes a method and system which provides a user with various useful information concerning the CRU in the form of a printed document. The method and system makes the CRU information available to the user at the source of the problem, and at an identified time of need in the printing machine. The information is provided in one convenient place, in the form of a printed document; Kurtz Page 1 Paragraph 3 & 4.

Therefore, it would be obvious to combine Muto, Tabb, Kinoshita, and Kurtz's to arrive to the limitations of claim 14.

8. Claim 29 is rejected under 35 U.S.C. 103(a) as being unpatentable over Muto, Tabb, Kinoshita in view of Narushima (US Patent 6831755).

Regarding claim 29, Muto, Tabb and Kinoshita taught the method of claim 26, as described above. Wherein said performing a replacement action requires an administration setting, password, or other form of authentication.

Muto, Tabb, Kinoshita do not explicitly teach wherein said performing a replacement action requires an administration setting, password, or other form of authentication.

However Narushima teaches wherein said performing a replacement action requires an administration setting, password, or other form of authentication.

(Narushima discloses a step of checking the password before updating/rewriting software program column 17 lines 12-25)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Muto, Tabb and Kinoshita to include Narushima. One of ordinary skill in the art would have been motivated to make this modification in order to have authorized personnel making the updates.

Therefore, it would be obvious to combine Muto, Tabb, Kinoshita and Narushima to arrive to the limitations of claim 29.

9. Claims 41, 45, & 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tabb (US 6735399 B2) in view of Kinoshita(2003/0107762).

Regarding claim 41, Tab teaches discloses a consumable for use with a printing device, said consumable comprising: a printing device consumable; a memory module attached to said printing device consumable; ***(Tabb discloses the CRU 1, as already mentioned, is removable from the machine 100 and can be replaced by another CRU 1 if any of the process elements located therein begin to deteriorate. The CRU 1 has a memory chip or memory 30, as shown in FIG. 3, in the form of an EEPROM (Electrically Erasable Programmable Read Only Memory) mounted in the top cover of the CRU 1. Contact pads 31 are provided on the memory chip 30 so that, when the CRU 1 is inserted into the machine 100, the memory chip 30 is***

Art Unit: 2446

automatically connected to the machine control unit/CPU via a terminal block 32 on a part 33 of the machine 100; Column 4 lines 26-36)

Tabb does not specifically teach emails being stored on a memory module.

However Kinoshita teaches emails being stored on memory. **(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)**

Further it would be obvious to a person of ordinary skill in the art at the time of the invention to modify the Muto's email data transfer system and Tab's replaceable consumable printing device with memory to include Kinoshita's Printing system. One of ordinary skill in the art would have been motivated to make this modification in order to show emails can be stored in a removable/remote memory and transmitting email to a printer's memory. This will allows for easier printing of emails at any given time.

Therefore, it would be obvious to combine Tabb, and Kinoshita to arrive to the limitations of claim 41.

Regarding claim 45, Tabb in view of Kinoshita taught the consumable of claim 41, as described above. Tabb further comprising a wired interface for said memory module for interfacing and communicating with a printing device. ***(Tabb discloses the CRU 1, as already mentioned, is removable from the machine 100 and can be replaced by another CRU 1 if any of the process elements located therein begin to deteriorate. The CRU 1 has a memory chip or memory 30, as shown in FIG. 3, in the form of an EEPROM (Electrically Erasable Programmable Read Only Memory) mounted in the top cover of the CRU 1. Contact pads 31 are provided on the memory chip 30 so that, when the CRU 1 is inserted into the machine 100, the memory chip 30 is automatically connected to the machine control unit/CPU via a terminal block 32 on a part 33 of the machine 100; Column 4 lines 26-36)***

Regarding claim 46, Tabb in view of Kinoshita taught the consumable of claim 41, as described above. Kinoshita also teaches further comprising an email message interface stored on said memory module which, when uploaded to a printing device, allows access and use of said email messages on said memory module. ***(Kinoshita discloses the memory section 5A stores at least data needed to download an e-mail addressed to the user from the mail server 60. Data needed to download an e-mail, as shown in FIG. 9B, consists of data representing connection information***

Art Unit: 2446

for connecting the printer 40 to the mail server 60, a user ID, a password, an e-mail address and so forth; Page 8 paragraph 229. The index generating section 44A accesses the mail server 60 for which the user has made a contract by using data read from the memory card 5 by the reading apparatus 45. The index generating section 44A downloads e-mails addressed to the user from the accessed mail server 60 and stores them in the mail buffer 53. The index generating section 44A generates data of the index screen which shows the index of an "unopened" e-mail in those e-mails downloaded. The index generating section 44A then sends the generated data of the index screen to the panel controller 43; Page 9 Paragraph 238 & 239.)

10. Claim 42 rejected under 35 U.S.C. 103(a) as being unpatentable over Tabb, Kinoshita in view of Hatasa (US 2003/0214546).

Regarding claim 42, Tabb and Kinoshita taught the consumable of claim 41, as described above. Comprising a wireless interface for said memory module for interfacing and communicating with a printing device.

Tabb and Kinoshita do not explicitly teach comprising a wireless interface for said memory module for interfacing and communicating with a printing device.

However Hatasa teaches comprising a wireless interface for said memory module for interfacing and communicating with a printing device. ***(Hatasa discloses referring to***

Art Unit: 2446

FIG. 8, in the bottom portion of the internal space of the printer main assembly 201, there is disposed a secondary scan mechanism (unshown) comprising a feed roller 204, a driving motor 205, etc. A sheet of printing paper P is conveyed frontward so that it opposes the ink jet head 203 from underneath; Page 4 Paragraph 64. Hatasa also discloses further, in the top portion of the internal space of the printer main assembly 210, there is disposed a single communication unit 206, as both a power supplying means and a wireless communicating means. Not only does this communication unit 206 electromagnetically induce electric current in the corresponding induction coil 138 of the ink cartridge 100, but also it wirelessly exchanges predetermined types of information with the first portion 132 of the radio antenna 131 of the ink cartridge 100. However, there a four ink cartridges 100 different in type, which are moved in the direction in which they are aligned as described above. Therefore, the single communication unit 206 wirelessly communicates with each of the four ink cartridges 100 as each ink cartridge 100 is moved into the area in which the communication unit 206 falls into communication range RS of each ink cartridge 100, as shown in FIG. 9.; Page 4 paragraph 64)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Tabb, Kinoshita, to include the wireless interface of Hatasa. One of ordinary skill in the art would have been motivated to make this modification in order to eliminate the fear that the data communication between the printer main assembly 201

Art Unit: 2446

and the ink container 100 might be unsatisfactory due to the electrical contact errors between them traceable to the ink 104; Hatasa Page 5 Paragraph 84.

Therefore, it would be obvious to combine Tabb, Kinoshita and Hatasa to arrive to the limitations of claim 42.

11. Claims 43 & 44 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tabb (US 6735399 B2), Kinoshita(2003/0107762) , Hatasa (US 2003/0214546) in view of Richards (US Patent 6532351).

Regarding claim 43, Tabb, Kinoshita, Hatasa taught the consumable of claim 42, as described above. Tabb, Kinoshita, Hatasa do not specifically teach wherein said wireless interface comprises a radio frequency interface.

However, Richards teaches wherein said wireless interface comprises a radio frequency interface. **(Richards discloses the method of communicating with other printer**

component via wireless communication means, such as by infrared or RF;

Column 5 lines 10-32)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Tabb, Kinoshita, and Hatasa's wireless consumable interface to include an infrared wireless communication interface of Richard. One of ordinary skill in the art would have been motivated to make this modification in order to a verity of different Wireless interfaces which are well known.

Therefore, it would be obvious to combine Tabba, Kinoshita, Hatasa and Richards to arrive to the limitations of claim 43.

Regarding claim 44, Tabb, Kinoshita, Hatasa, and Richards taught the consumable of claim 42, as described above. Richards teaches wherein said wireless interface comprises an infrared interface.

(Richards discloses the method of communicating with other printer component via wireless communication means, such as by infrared or RF; Column 5 lines 10-32)

12. Claim 48 is rejected under 35 U.S.C. 103(a) as being unpatentable over Muto (US 2002/0116480), Tabb (US 6735399 B2), Kinoshita (2003/0107762) in view of Hatasa (US 2003/0214546).

Regarding claim 48, Muto, Tabb and Kinoshita taught the printing device of claim 47, as described above. Further comprising a wireless interface for said memory module for interfacing and communicating with a printing device.

Although Muto, Tabb and Kinoshita do not teach comprising a wireless interface for said memory module for interfacing and communicating with a printing device.

However Hatasa teaches comprising a wireless interface for said memory module for interfacing and communicating with a printing device. **(Hatasa discloses referring to**

FIG. 8, in the bottom portion of the internal space of the printer main assembly

Art Unit: 2446

201, there is disposed a secondary scan mechanism (unshown) comprising a feed roller 204, a driving motor 205, etc. A sheet of printing paper P is conveyed frontward so that it opposes the ink jet head 203 from underneath; Page 4 paragraph 64. Hatasa also discloses further, in the top portion of the internal space of the printer main assembly 210, there is disposed a single communication unit 206, as both a power supplying means and a wireless communicating means. Not only does this communication unit 206 electromagnetically induce electric current in the corresponding induction coil 138 of the ink cartridge 100, but also it wirelessly exchanges predetermined types of information with the first portion 132 of the radio antenna 131 of the ink cartridge 100. However, there a four ink cartridges 100 different in type, which are moved in the direction in which they are aligned as described above. Therefore, the single communication unit 206 wirelessly communicates with each of the four ink cartridges 100 as each ink cartridge 100 is moved into the area in which the communication unit 206 falls into communication range RS of each ink cartridge 100, as shown in FIG. 9.; Page 4 paragraph 64)

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Muto, Tabb and Kinoshita to include the wireless interface of Hatasa. One of ordinary skill in the art would have been motivated to make this modification in order to eliminate the fear that the data communication between the printer main assembly 201 and the ink container 100 might be unsatisfactory due to the electrical contact errors between them traceable to the ink 104; Hatasa Page 5 Paragraph 84.

Art Unit: 2446

Therefore, it would be obvious to combine Muto, Tabb, Kinoshita and Hatasa to arrive to the limitations of claim 48.

13. Regarding Claims 49 & 50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Muto, (US 2002/0116480) Tabb (US 6735399), Kinoshita(2003/0107762) , Hatasa (US 2003/0214546) in view of Richards (US Patent 6532351

Regarding claim 49, Muto, Tabb, Kinoshita and Hatasa taught the printing device of claim 48, as described above. They do not teach wherein said wireless interface comprises a radio frequency interface.

However, Richards teaches wherein said wireless interface comprises a radio frequency interface. **(Richards discloses the method of communicating with other printer component via wireless communication means, such as by infrared or RF; Column 5 lines 10-32)**

It would be obvious to a person of ordinary skill in the art at the time of the invention to modify Muto, Tabb, Kinoshita and Hatasa's wireless consumable interface to include an infrared wireless communication interface of Richards. One of ordinary skill in the art would have been motivated to make this modification in order to a verity of different Wireless interfaces which are well known.

Therefore, it would be obvious to combine Muto, Tabb, Kinoshita, Hatasa and Richards to arrive to the limitations of claim 49.

Regarding claim 50, Muto, Tabb, Kinoshita and Hatasa taught the printing device of claim 48, as described above. Richards for the same motivation as claim 49, further teaches wherein said wireless interface comprises an infrared interface. **(Richards discloses the method of communicating with other printer component via wireless communication means, such as by infrared or RF; Column 5 lines 10-32)**

Response to Arguments

14. Applicant's arguments with respect to claims 1, 2, 7-16, 25-29, 41-52 have been considered but are moot in view of the new rejection.

Regarding claim 7, Applicant argues that no printing device consumable in Kinoshita stores email messages. Examiner views Kinoshita explains emails which can be stored in memory and downloaded to personnel. Tabb explains a printer cartridge with a memory device attached to it which can store data. Thus the combination explains the limitations of claim 7.

Regarding claim 47, Applicant makes same argument combination of Muto, Tabb, and Kinoshita fails to teach or even suggest that printer access email messages stored in the printer cartridge or that the printer loads emails from print cartridge to the printer. Examiner views Tabb explains a printer cartridge with a memory device attached to it which can store data. This data can be transmitted into a printer. Kinoshita explains

Art Unit: 2446

emails which can be stored in memory and downloaded to personnel. Thus having the combination including Mutto would explain the limitations of claim 47. Further, reference Kurtz also shows most of these limitations.

Examiner views the rest of the arguments are very similar, and respectfully disagrees based on the above rejection.

Conclusion

15. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Gerald Smarth whose telephone number is (571)270-1923. The examiner can normally be reached on Monday-Friday(7:30am-5:00pm)est.

Art Unit: 2446

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Jeff Pwu can be reached on (571)272-6798. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>.
